

AI-Powered Stablecoin Remittance Router

Programmable Money That Chooses the Best Way to Move

One-Line Pitch

An AI treasury agent that routes stablecoin payments through the cheapest, fastest, and most reliable path automatically, using MNEE as the universal settlement layer.

The Problem

Africa receives over **\$100B in remittances annually**, yet sending money remains:

- **Expensive** — 3–7% fees
- **Slow** — minutes to days
- **Opaque** — hidden FX spreads
- **Fragmented** — mobile money, banks, crypto, cash pickups

Users must manually choose *how* to send money without knowing: - Which route is cheapest *right now* - Which route is fastest *right now* - Which route will actually succeed

This is a **coordination failure** between: - Blockchains - Mobile money operators - FX markets - Payment processors

The Solution

AI-Powered Stablecoin Remittance Router

A **non-custodial, agent-driven payment system** where:

- Users specify **intent**, not infrastructure
"Send \$100 to Alice in Kenya"
- An **AI routing agent** automatically:
 - Evaluates all available payment rails
 - Selects the optimal route
 - Executes the transaction
- **MNEE stablecoin** is used as:
 - The routing currency
 - The settlement layer
 - The accounting unit

The user never sees the complexity — only **faster and cheaper delivery**.

System Architecture

Core Innovation: AI Routing Agent

The AI agent treats remittance as a **dynamic routing problem**, similar to internet packet routing.

The agent evaluates:

- On-chain gas fees
- Bridge and liquidity fees
- FX spreads
- Liquidity availability
- Delivery time
- Failure probability
- Regulatory constraints per corridor

Output:

Optimal Route = Lowest Cost + Highest Reliability

Example route:

```
graph TD; A[MNEE (Ethereum)] --> B[→ Celo Bridge]; B --> C[→ Local Stable]; C --> D[→ M-Pesa]; D --> E[→ Recipient];
```

A vertical list showing an example route. It starts with 'MNEE (Ethereum)', followed by '→ Celo Bridge', '→ Local Stable', '→ M-Pesa', and finally '→ Recipient'.

The agent executes autonomously, paying gas and bridge fees on behalf of the user.

Why MNEE Is Essential

MNEE is **not optional** in this system.

MNEE is used for:

1. **Universal Settlement Currency** — all routes normalize value into MNEE
2. **Agent Accounting Unit** — AI compares routes in MNEE terms
3. **Fee & Incentive Token** — solvers and liquidity providers are paid in MNEE
4. **Programmable Treasury Asset** — enterprises automate global payouts

Without MNEE, the router cannot function.

Key Features (Winning Checklist)

1. Intent-Based Payments

Users declare *what* they want to do, not *how* to do it.

2. AI Route Optimization Engine

- Rule-based MVP (hackathon-friendly)
 - Upgradeable to ML / reinforcement learning
 - Pluggable data sources (oracles, APIs)
-

3. Programmable MNEE Smart Contracts

- Route execution contract
 - Fee accounting contract
 - Failure fallback logic
 - Partial fulfillment handling
-

4. Non-Custodial Architecture

- User signs intent
 - Agent executes but **never holds user funds**
 - Fully transparent on-chain execution
-

5. Multi-Rail Support (MVP)

- Ethereum ↔ Celo
 - Stablecoin ↔ Mobile Money (mocked APIs)
 - Direct wallet transfers
-

6. Real-Time Cost Comparison Dashboard

Live UI displays: - Traditional fee vs Router fee - Percentage savings - Estimated delivery time

7. Automatic Failure Recovery

- If a route fails, the agent reroutes instantly
 - No user intervention
 - No loss of funds
-

8. Developer-First API

```
POST /send
{
  amount: 100,
  currency: "USD",
  destination: "KE-MPESA",
  priority: "cheapest"
}
```

Positions the project as **infrastructure**, not just an app.

Hackathon MVP Scope

Must Build:

- MNEE routing smart contract
- AI routing logic (rule-based)
- 2-3 mocked payment rails
- Frontend dashboard
- Live on-chain MNEE transaction

Can Be Mocked:

- Mobile money APIs
 - FX oracle feeds
-

Demo Flow (Judge-Optimized)

1. User inputs: *Send \$100 to Kenya*
2. Dashboard shows possible routes
3. AI selects cheapest path
4. MNEE transaction executes on-chain
5. Confirmation appears
6. Savings displayed visually

Impact Metrics

- Average remittance cost: **~5%**
 - Router cost: **0-1%**
 - Cost reduction: **80-95%**
 - Market size: **\$100B+**
 - Target users: Migrants, SMEs, NGOs, DAOs
-

Why This Wins the MNEE Hackathon

Criterion	Why It Scores High
Technological Implementation	AI + smart contracts + automation
Design & UX	Intent-based simplicity
Impact Potential	Massive, measurable savings
Originality	First AI-driven remittance router
Coordination Solved	Automates multi-rail payments

Future Extensions

- Enterprise treasury automation
 - Payroll for remote teams
 - NGO aid distribution
 - Creator payouts
 - DAO contributor payments
-

Final Tagline

Money shouldn't ask you how to move. It should figure it out itself.
